Structure and configuration of MQ-4 gas sensor is shown as Fig. 1 (Configuration A or B), sensor composed by micro Al_2O_3 ceramic tube, Tin Dioxide (SnO_2) sensitive layer, measuring electrode and heater are fixed into a crust made by plastic and stainless steel net. The heater provides necessary work conditions for work of sensitive components. The enveloped MQ-4 have 6 pin ,4 of them are used to fetch signals, and other 2 are used for providing heating current.

Electric parameter measurement circuit is shown as Fig.2

Fig.3 is shows the typical sensitivity characteristics of the MQ-4 for several gases. in their: Temp: 20°C, Humidity: 65%, O_2 concentration 21% $R_L=20k \Omega$

R_o : sensor resistance at 1000ppm of CH_4 in the clean air.
 R_s :sensor resistance at various concentrations of gases.

Fig.4 is shows the typical dependence of the MQ-4 on temperature and humidity. R_o : sensor resistance at 1000ppm of CH_4 in air at 33%RH and 20 degree.
 R_s : sensor resistance at 1000ppm of CH_4 in air at different temperatures and humidities.

SENSITIVITY ADJUSTMENT

Resistance value of MQ-4 is difference to various kinds and various concentration gases. So,When using this components, sensitivity adjustment is very necessary. we recommend that you calibrate the detector for 5000ppm of CH_4 concentration in air and use value of Load resistance (R_L) about $20K \Omega$ ($10K \Omega$ to $47K \Omega$).

When accurately measuring, the proper alarm point for the gas detector should be determined after considering the temperature and humidity influence.
